BakBone Software is the leader in Universal Data Management. This strategy encompasses a data-centric approach to integrating data protection, centralizing policy management and managing organizations' messaging infrastructure to optimize performance, increase data availability and improve corporate compliance.

Overview

BakBone was launched in 2000 with software technology originally developed by AT&T Bell Labs in the United Kingdom. Today, BakBone is a leading provider of Universal Data Management solutions which provide a data-centric approach to data protection, policy management and message management.

BakBone products are used by a range of businesses, including global Fortune 1000 corporations and domestic and international government entities. These scalable solutions are distributed through a worldwide network of select OEM partners, strategic partners, resellers and solution providers. BakBone is headquartered in San Diego, Calif.

Product Portfolio

BakBone boasts a unique portfolio of technologies and business solutions resulting from the combination of BakBone and the acquisitions of Cold Spark and technology assets from Asempra. This portfolio provides solutions that can be used to apply a common set of services such as protection, availability, message-routing, centralized policy management and compliance to each unique piece of data for our customers.

The combined portfolio integrates with BakBone's open data protection platform -- allowing policies to be set across common data used across different applications -- regardless if it is in a physical, virtual or cloud environment. Customers are enabled to manage data at rest, in a structured repository or file system, as well as dynamically as data is routed across messaging systems or network infrastructure.

BakBone's technologies utilize a modular design to deliver maximum performance while supporting flexible implementation strategies. With extensive support for heterogeneous environments, including Windows, Linux, UNIX, and Mac OS, as well as end-user and application data, BakBone's technologies can be installed in minutes and scale to support hundreds of servers and clients.

BakBone's product suite includes

[NetVault: Backup](#)

[ColdSpark SparkEngine Mail Transport Platform](#)

[NetVault: FASTRecover](#)

[NetVault: Replicator](#)

[NetVault: Report Manager](#)

These solutions provide comprehensive backup, disaster recovery, replication, storage monitoring, message and policy management and reporting software. Fully functioning evaluation software is available for download from BakBone's corporate website:
